

Transform Every Parking Lot into Sustainable Solar Energy

Solar Carports allow for a number of panels to be installed over existing parking spaces.

Solar Carports require no additional cost for land [as ground mounts do] and have a minimal cost for transmission.

Rooftop solar designs are limited to the buildings' physical roof area availability.

Parking lots are ideal for solar carport installation!

Benefits of Solar Carports

Solar Carports make it possible to be energy self-sufficient.

By having an on-site power plant, a business can limit the impact of costly rate increases, blackouts and brownouts, and remain in production.

Stabilizing its cash flow!

Numerous states offer **Solar Carport** installation incentives.

- Investment Tax Credit
- Rebates
- Grant Programs
- SMART programs

Solar Carports make parking safer.

LED Lights installed on the structure, and powered by the solar system, cast more light per square foot; lighting up more spaces than one light pole!

Solar Carports capture more sunlight!

Engineers design their solar support systems to tilt in a specific direction.
