**Objective.** Amphotericin B (AmB) is the antifungal drugs that present most potent activity and wider spectrum of action, but its use has been classically limited by its secondary effects. To reduce the toxicity, nowadays it is mainly administered as liposomal formulation, mainly AmBisome (Gilead). Paradoxically, a full description of the activity of the AmB used in this formulation has not been reported. The objective of this study is to describe the in vitro antifungal activity of AmB used in the AmBisome formulation.

**Methods.** We carried out a multicenter study to characterize the antifungal susceptibility to AmB from AmBisome (provided by Gilead, G-AmB). We used two standardized methods, CLSI and EUCAST. We evaluated this activity against the most prevalent fungi in clinic (including both yeasts and filamentous fungi). Representative isolates from different geographical regions were included. Other antifungals were evaluated (fluconazole, itraconazole, voriconazole, posaconazole, caspofungin, micafungin and anidulafungin).

## RESULTS

We summarize the susceptibility of yeast and filamentous fungi to G-AmB and other antifungals. The number of isolates (N) and Geometric Mean (GM, mg/L) of the MIC values is shown. In total we obtain around 4,000 MICs. Data of CLSI and EUCAST have been grouped.

Species		G-AmB	Fluconazole	Voriconazole	Caspofungin	Micafungin	Anidulafungin
<i>Candida albicans</i>	N	196	196	196	196	196	196

G-AmB shows a strong activity against most yeasts using both protocols (EUCAST and CLSI), in particular *C. albicans*, *C. parapsilosis* and *C. glabrata*. It also has a strong activity against *C. auris* (which was fully resistant to fluconazole) and *C. neoformans* (resistant to echinocandins). The least susceptible yeasts were *Trichosporon* and *Rhodotorula* (GM around 2.5 mg/L).

The activity of G-AmB against filamentous fungi strongly depends on the species. *Aspergillus fumigatus* and *A. niger* are the most susceptible molds(GM 0.3-0.5 mg/L) . MICs to G-AmB were higher for the other *Aspergillus* spp, (geometric mean around 1-2 mg/L). G-AmB also showed a strong activity against other fungi that showed reduced susceptibility to other antifungals, such as *F. solani* and *F. oxysporum*, *Mucor* and *Rhizopus*. In contrast, G-AmB had limited activity against some multiresistant fungi, such as *Lomentospora* and *Scedosporium*
