

# IMPACT (Infection Management Plus Addiction Care Together)

## Pilot Combined Contingency Management for Substance Use Disorders & Antibiotic Adherence in the Acute Care Setting

Ayesha Appa, MD<sup>1</sup>; Brianna Stein<sup>1</sup>; Stefan Baral<sup>2</sup>; Kelly Knight<sup>1</sup>; Monica Gandhi<sup>1</sup>; Phillip Coffin<sup>3</sup>; Marlene Martin<sup>1</sup>

### Background

- ❖ Contingency management (CM) is an underutilized strategy that may be effective in addressing syndemics of infectious diseases and substance use disorders (SUD).
- ❖ CM implementation outside of drug treatment settings is limited, despite its regard as gold-standard treatment for stimulant use disorder and potential use to support infection treatment completion.
- ❖ **Objective:** To describe feasibility and preliminary effectiveness of a novel CM program incentivizing both drug use reduction and antibiotic adherence in the acute care setting.

### Results

**Table 1: Demographic & Baseline Characteristics of IMPACT Participants (n=13)**

	N = 13
Median age (IQR), years	39 (35—67)
Female sex, N (%)	6 (46%)
Unstably housed	10 (77%)
Infection: osteomyelitis	7 (54%)
Infection: endocarditis	6 (46%)
Stimulant use disorder	9 (69%)
Opioid use disorder	10 (77%)
Prior knowledge of CM	0 (0%)

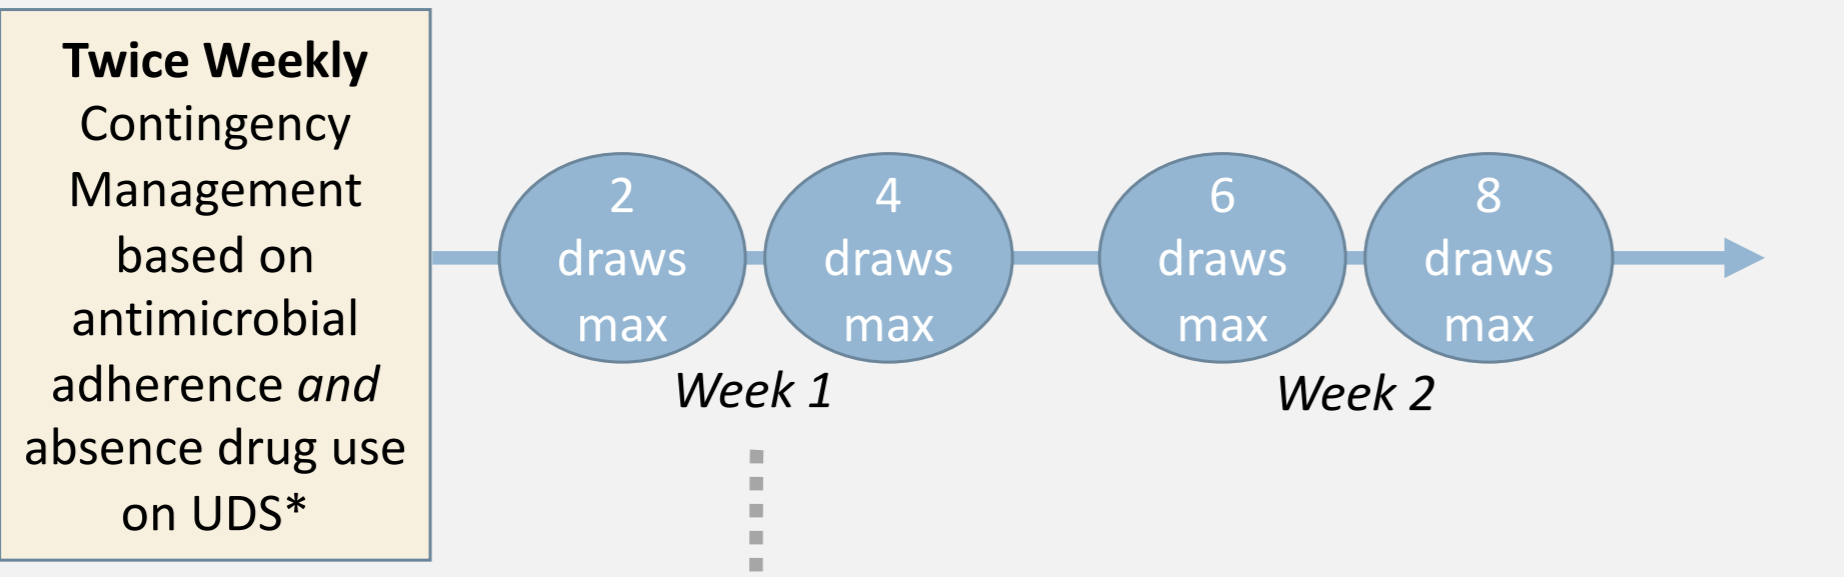

**Table 2: Contingency Management (CM) Outcomes by Participant**

ID	Feasibility		Effectiveness				
	CM visits attempted: CM visits completed	Value of gift cards earned	Urine drug tests negative for non-prescribed drugs	Infection treatment complete	Discharge type	Participant-reported CM effectiveness for antibiotic completion (1-10)*	Participant-reported CM effectiveness for drug use reduction (1-10)*
1	14:12	\$460	12/12 (100%)	Yes	Standard	9	6
2	1:1	\$10	1/1 (100%)	Yes	Standard	No exit data	No exit data
3	5:2	\$20	2/2 (100%)	Yes	Standard	No exit data	No exit data
4	3:3	\$100	3/3 (100%)	Yes	Standard	10	5
5	4:3	\$70	3/3 (100%)	Yes	Standard	10	8
6	6:5	\$140	5/5 (100%)	Yes	Patient-directed	10	3
7	4:2	\$10	0/2 (0%)	No	Patient-directed	No exit data	No exit data
8	6:4	\$40	4/4 (100%)	Yes	Standard	7	2
9	10:6	\$180	6/6 (100%)	Yes	Standard	9	7
10	8:7	\$390	7/7 (100%)	Yes	Standard	10	10
11	10:7	\$240	1/7 (14%)	Yes	Standard	7	7
12	12:7	\$290	7/7 (100%)	Yes	Standard	8	5
13	8:4	\$110	4/4 (100%)	Yes	Standard	10	8

### Methods

**What is contingency management?**  
More specific than simple incentive use, CM is a behavioral treatment program utilizing operant conditioning, historically used to encourage abstinence from drugs. Frequent assessment of objective behavior change earns incentives, often escalating if sustained.

- INCLUSION CRITERIA**
- Opioid use disorder and/or stimulant use disorder
  - interested in reducing use
  - Serious infection needing at least 2 weeks of antimicrobial in SNF or hospital setting
- ENROLLMENT**
- Baseline interview + urine collection
  - Priming draw (draw until monetary prize received)

Example Week 1 visit

### Conclusions

- ❖ We performed a **pilot CM program in the hospital and attached skilled nursing facility to support antibiotic completion and reduced substance use** in people with stimulant and/or opioid use disorders hospitalized with osteomyelitis and/or endocarditis.
- ❖ **Effectiveness as measured by antibiotic completion was high, 92%.** Most participants (all of whom without prior knowledge of CM) reported program extremely effective in aiding infection treatment with greater inter-participant variability in beliefs re: CM facilitation of reduced drug use.
- ❖ Feasibility challenges identified include relatively short duration of program engagement in acute care setting and supporting staff time when multiple attempts needed to complete CM visit.
- ❖ As is true for other addiction treatments, offering CM in the acute care setting may represent a reachable moment that both introduces patients to this SUD treatment modality and supports infection treatment completion.
