

# USE OF RELOADABLE CLIPS DURING PER-ORAL ENDOSCOPIC MYOTOMY (POEM) IS SAFE, **EFFECTIVE, AND COST EFFECTIVE**

#### BACKGROUND

- **Endoscopic clip closure is routinely used in Per-Oral** Endoscopic Myotomy (POEM).
- POEM is a safe and effective procedure for achalasia pat (pts) when the endoscopist is properly trained.
- Clip use can be costly and our large volume tertiary center seen a rise in clip utilization overall.
- **Continued POEM evolution will lead to improved outcon** and increased cost-effectiveness.

### AIMS

We aim to evaluate the performance and cost effectiven implementing the newly available (in USA) Reloadable C (RC) in addition to standard, Single-use clips (SC) during closure in POEM.

#### METHODS

- A retrospective cohort study of consecutive pts undergoi POEM for achalasia (before/after introduction of RC) was undertaken.
- Pt demographics, disease/treatment characteristics were recorded.
- POEM was performed by a single-trained Advanced Interventional Endoscopist with standardized protocol.
- All pts were admitted to observation with barium esophagram within 12 hours of POEM.
- Treatment efficacy was measured by immediate technic success, absence of leak on esophagram, and symptom evaluation at follow-up.
- Treatment related adverse events recorded were dyspha bleeding requiring transfusion, leak on esophagram, ED and emergency operation.
- Procedural details of incision length, anterior/posterior approach, type of incision, myotomy length, and number type of clips (RC vs SC - (Figure 1)) used for zipper closure technique were noted.
- Cost of clips used per case was calculated.
- Statistical analysis with Fisher's exact and two-tailed unp T test was performed.

#### RESULTS

- 24 achalasia pts (Table 1) were evaluated.
- 14/24 (58%) patients were in Group 1 (RC+SC) and 10/24 (42%) were in Group 2 (SC only).
- 24/24 patients had immediate technical success and no early treatment related adverse events.
- Mean total number of clips/case in Group 1 (6.4 + 1) and Group 2 (5.7 <u>+</u> 1.1) did not differ (p=0.15).
- Mean myotomy length in Group 1 vs Group 2 was (8.7cm vs 7.3cm, p=0.08).
- Cost for RC was \$100.50 for 1st clip, \$39.50 for 2nd clip, and \$39.50 for each subsequent clip.
- The cost for each SC was \$150.
- Mean total clip cost per case in Group 1 was \$454 compared to \$855 for Group 2 (p<0.001).

Zipper closure technique (*figure 1a*); RC clip (*yellow arrows, figure 1a*); SC clip (blue arrow, figure 1a); opening width of RC (figure 1b), 135degree jaw of RC (*top of figure 1c*)

## **CONCLUSION**

- Use of RC in POEM was safe, technically successful, and highly cost effective.
- **RC** can be used alongside SC for zipper closure technique.
- Further prospective studies evaluating their use in EMR/ESD may lead to similar cost savings.
