#### BACKGROUND

- ✤ The HAS-BLED score is a decision tool for starting anticoagulation for patients with atrial fibrillation.
- It has not been validated in patients following coronary stenting to assess bleeding risks.

### **OBJECTIVE & HYPOTHESIS**

- ✤ We aimed to determine whether the HAS-BLED score was associated with a rebleed after an index gastrointestinal bleed (GIB) following coronary stenting.
- ✤ We hypothesized as the HAS-BLED score increases, so does the risk of a rebleed.

#### METHODS

- Retrospective study across Mayo Clinic Florida between January 2015 and December 2021.
- Inclusion criteria: 1) successful coronary stenting, 2) initiation of DAPT, 3) index GIB after coronary stenting 4) age 18 years or older.
- Exclusion criteria: if any of the above not met or lost to follow up at 365 days.
- The primary outcome was a rebleed at 365 days.
- Univariable analysis performed using Wilcoxon Rank Sum Test or Fisher Exact Test.
- Multivariable Logistic Regression Analysis with Bootstrap Resampling and Kaplan-Meier Estimates were performed.

#### CONCLUSIONS

- ✤ In this single-center retrospective cohort study, we found the HAS-BLED score was strongly associated with a rebleed at 365 days in patients who had an index GIB after coronary stenting.
- The strongest predictors of a rebleed included having an index GIB within 180 days of coronary stenting, having a pre-catheterization endoscopy performed, a labile INR, and a STEMI.
- ✤ A simplified scoring system with these 4 variables may be constructed to predict a rebleed at 365 days for this patient population.

✤ A total of 64/183 patients (35.0%) had a rebleed after the index GIB following coronary stenting at 365

♦ Of the 183 patients included, 178 (97.3%) were still on DAPT at the time of GIB. Of these 178 patients, 154 patients (86.5%) had their P2Y12 inhibitor continued at discharge from the hospital.

On univariable analysis, labile INR, HAS-BLED score, hemoglobin prior to catheterization, time to index GIB, hemoglobin and INR at GIB were strongly associated with a rebleed at 365 days . Table 1.

On multivariable logistic regression analysis, every 1point increase in the HAS-BLED score was associated with a 39% increased odds of a rebleed. Amongst the individual parts of the HAS-BLED score, labile INR was the strongest predictor of a rebleed, OR 4.5, 95% CI: 2.14-9.49, p < 0.001. Table 2.

✤ As the HAS-BLED score increased, so did the incidence of rebleed at 365 days: incidence 21.1% at score 2 vs 53.9% at score 6 or 66.7% at score 7, RR: 2.56, p=0.0266 and RR: 3.17 p=0.0368, respectively [HAS-BLED score 2 as reference]. Figure 1.

Figure 1: Cumulative Incidence of Rebleed After Index GIB Following Coronary Stenting by HAS-BLED Score
