Introduction

- Standard first-line (1L) chemotherapy (chemo) for advanced or metastatic human epidermal growth factor receptor 2 (HER2)-negative gastric cancer/gastroesophageal junction cancer (GC/GEJC) results in poor median overall survival (OS) of < 1 year¹⁻⁴
- Nivolumab (NIVO) + chemo demonstrated superior OS vs chemo in advanced GC/GEJC/esophageal adenocarcinoma (EAC) after 12 months of minimum follow-up in CheckMate 649⁵
- Superior OS was coupled with clinically meaningful progression-free survival (PFS)
 benefit, improved and durable responses, and an acceptable safety profile⁵
- NIVO + chemo is now approved as 1L treatment for patients with advanced or metastatic GC/GEJC/EAC in many countries, including the United States, based on these results⁶
- We report expanded analyses of efficacy and safety for NIVO + chemo vs chemo after 24-month follow-up

Methods

• CheckMate 649 (NCT02872116) is a randomized, open-label, global phase 3 study⁵ (Figure 1)

Figure 1. CheckMate 649 study design

Dual primary endpoints:
OS and PFS^f (PD-L1 CPS ≥ 5)
Secondary endpoints:
OS (PD-L1 CPS ≥ 1, all randomized)
OS (PD-L1 CPS ≥ 10)
PFS^f (PD-L1 CPS ≥ 10, ≥ 1, all randomized)
ORR^f
Exploratory endpoints:
Safety

^aLess than 1% includes indeterminate tumor cell PD-L1 expression; ^bAfter NIVO + chemo arm was added and before new patient enrollment in the NIVO + IPI arm was stopped early (June 5, 2018) based on DMC recommendation; patients already enrolled in the NIVO + IPI arm were allowed to remain on study; ^cIncludes patients concurrently randomized to chemo vs NIVO + IPI (October 2016-June 2018) and to NIVO + chemo (April 2017-April 2019); ^dXELOX: oxaliplatin 130 mg/m² IV (day 1) and capecitabine 1000 mg/m² orally twice daily (days 1-14); FOLFOX: oxaliplatin 85 mg/m², leucovorin 400 mg/m², and FU 400 mg/m² IV (day 1) and FU 1200 mg/m² IV daily (days 1-2); ^eUntil documented disease progression (unless consented to treatment beyond progression for NIVO + chemo or NIVO + IPI), discontinuation due to toxicity, withdrawal of consent, or study end. NIVO is given for a maximum of 2 years; ^fBICR assessed. BICR, blinded independent central review; CPS, combined positive score; DMC, data monitoring committee; ECOG PS, Eastern Cooperative Oncology Group performance status; FU, fluorouracil; IPI, ipilimumab; IV, intravenous; ORR, objective response rate; PD-L1, programmed death ligand 1; Q2W, every 2 weeks; Q3W, every 3 weeks; QoL, quality of life; R, randomization; ROW, rest of world.

Results

- At data cutoff (May 27, 2021), the minimum follow-up (time from concurrent randomization of the last patient to clinical data cutoff) was 24.0 months in the NIVO + chemo arm
- Baseline characteristics were balanced across treatment arms (**Table 1**)

Table 1. Baseline characteristics

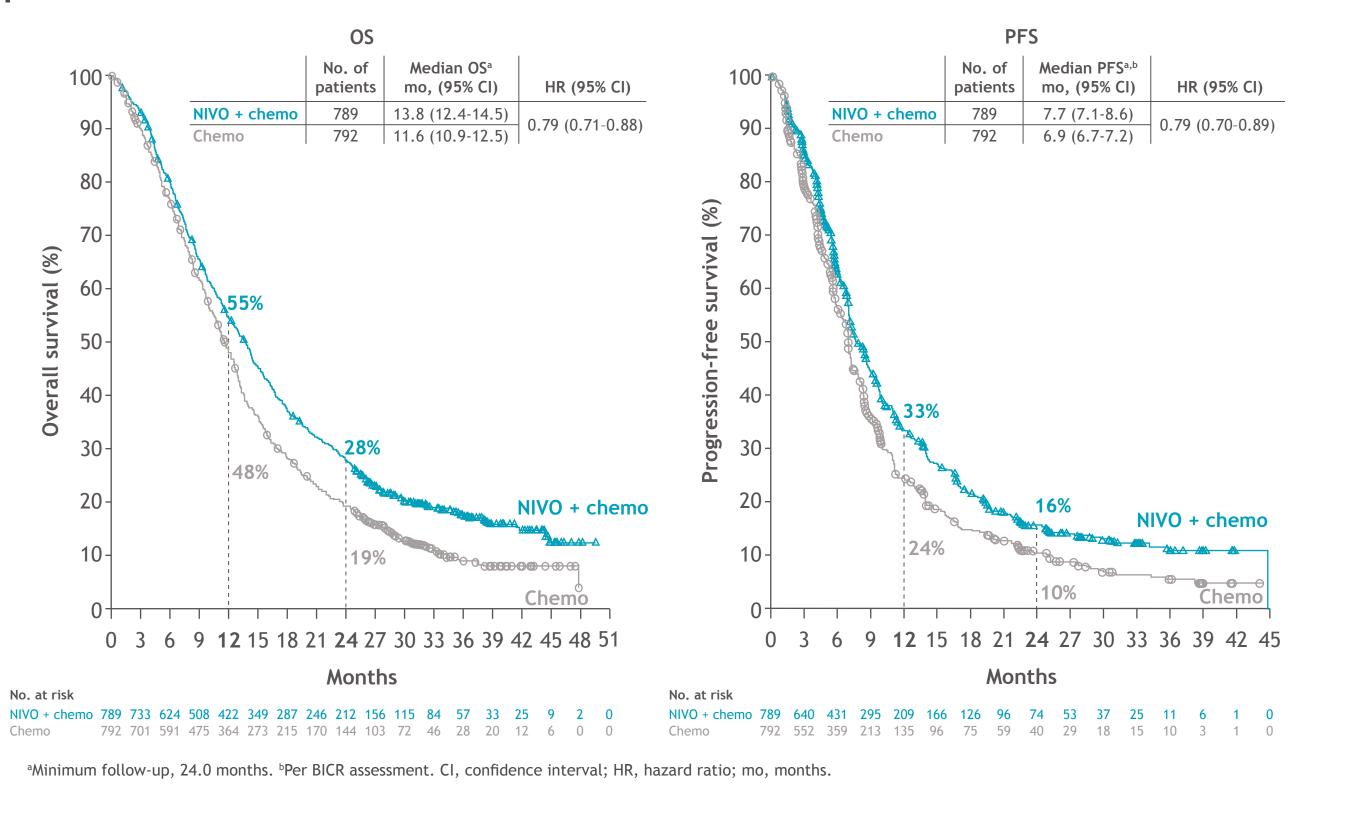

MSS, microsatellite stable; NLR, neutrophil to lymphocyte ratio. Adapted from Shitara K, et al. 7

All randomized ^a	NIVO + chemo (n = 789)	Chemo (n = 792)

^aPD-L1 CPS expression indeterminate/not evaluable/not reported, n = 19; ^bUnstratified HR for death (OS); ^cRandomized patients who had target lesion measurements at baseline, per BICR. PD-L1 CPS expression indeterminate/not evaluable/not reported, n = 14; ^dPercentages may not reflect an exact difference due to rounding. Adapted from Shitara K, et al.⁷

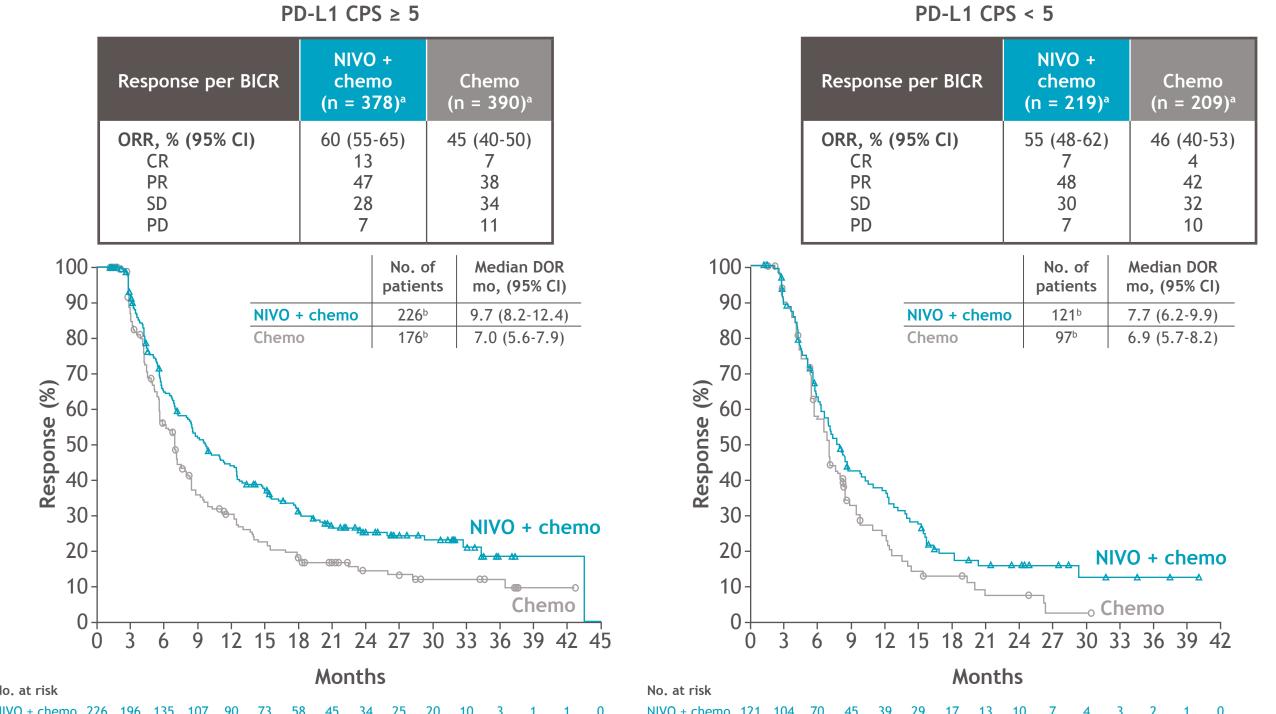

• OS and ORR benefits were consistent with the all randomized population when excluding patients with MSI-H tumors (MSI-H tumors, n = 44; MSS tumors, n = 1377; MSI-H status not reported/invalid, n = 160) (Figure 7)

Figure 7. Efficacy subgroup analysis by PD-L1 CPS excluding MSI-H

 ORR was higher and responses were more durable with NIVO + chemo vs chemo regardless of PD-L1 CPS ≥ 5 or < 5 (Figure 8)

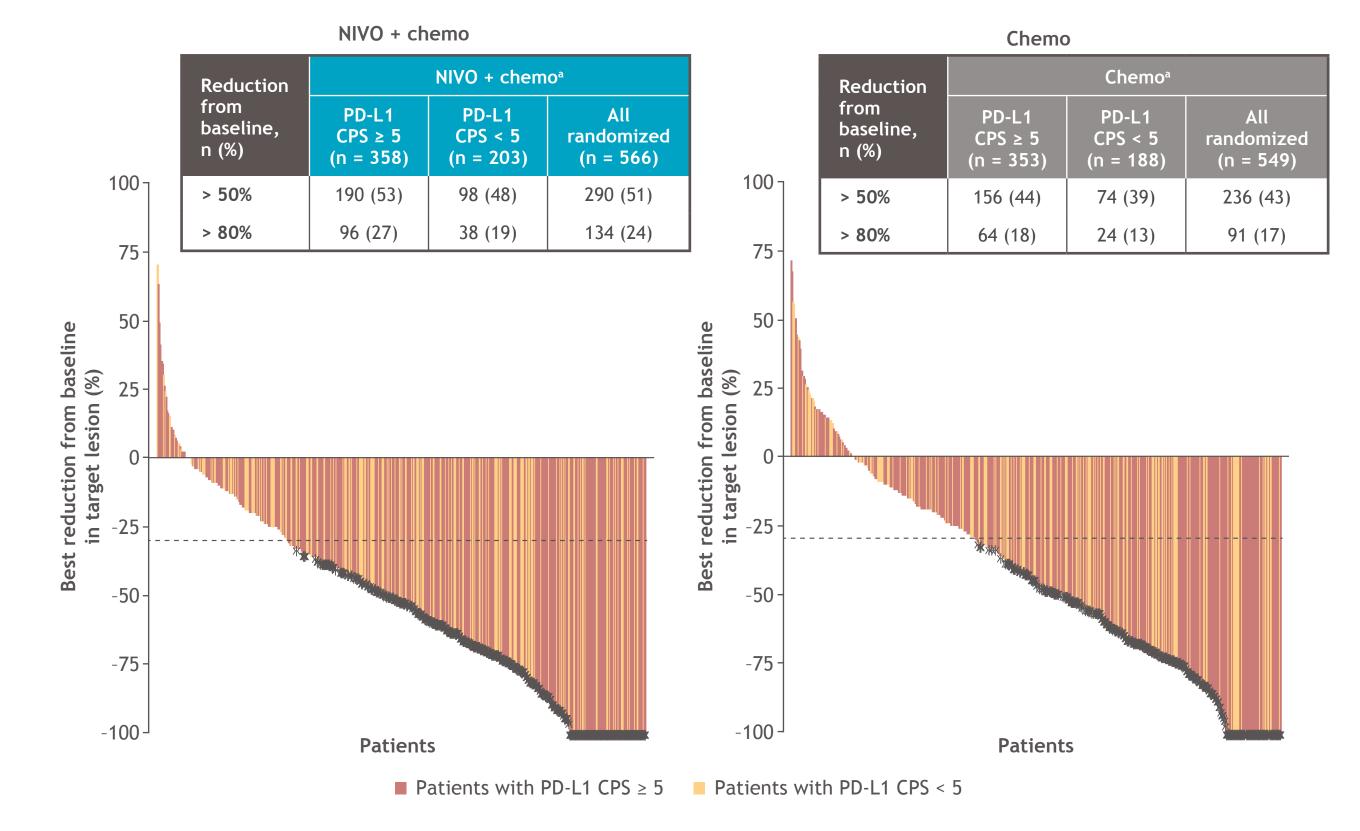

Figure 8. Response and duration of response

More deep responses were observed with NIVO + chemo vs chemo regardless of PD-L1
 CPS ≥ 5 or < 5 (Figure 9)

Figure 9. Best percentage reduction in tumor burden

progressive disease; PR, partial response; SD, stable disease. Adapted from Shitara K, et al

^aAll randomized patients who had measurable disease at baseline per BICR and at least 1 on-treatment tumor assessment. Best reduction is maximum reduction in sum of diameters of target lesions. Horizontal reference line indicates the 30% reduction consistent with a response per RECIST v1.1. Asterisk symbol represents responders. RECIST, Response Evaluation Criteria in Solid Tumors. Adapted from Shitara K, et al.⁷

Safety

Unstratified HR (95% CI)

- No new safety signals were identified with NIVO + chemo (Table 2)
- The most common grade 3/4 treatment-related adverse events (TRAEs) included:
- NIVO + chemo: neutropenia (15%), decreased neutrophil count (11%), anemia (6%)
- Chemo: neutropenia (13%), decreased neutrophil count (9%), diarrhea (3%)

Table 2. Treatment-related adverse events

All treated, ^a n (%)		782)	(n = 767)		
	Any grade	Grade 3/4	Any grade	Grade 3/4	
Any TRAEs ^b	739 (95)	471 (60)	682 (89)	344 (45)	
Serious TRAEs ^b	175 (22)	133 (17)	94 (12)	77 (10)

^aTRAEs with potential immunologic etiology that require frequent monitoring/intervention; ^bAssessed in all treated patients during treatment and for up to 30 days after the last dose of study treatment; ^cPatients who received ≥ 1 dose of study drug; ^dThe most common grade 3/4 events (≥ 2%) in the NIVO + chemo arm were diarrhea (n = 35), aspartate aminotransferase increased (n = 13), palmar-plantar erythrodysesthesia syndrome (n = 12), and pneumonitis (n = 12). There were no grade 5 events. IMM, immune modulating medication; NR, not reached. Adapted from Shitara K, et al.⁷

Conclusions

- NIVO + chemo continued to demonstrate clinically meaningful improvement in efficacy vs chemo with an acceptable safety profile with longer follow-up in previously untreated patients with advanced GC/GEJC/EAC
- Favorable PFS2
- OS benefit across key subgroups and enriched at higher PD-L1 CPS cutoffs
- Higher ORR across all evaluated PD-L1 CPS subgroups
- More deep and more durable responses regardless of PD-L1 CPS ≥ 5 or < 5
- OS and ORR benefit across PD-L1 CPS subgroups consistent with the all randomized population when excluding patients with MSI-H tumors
- No new safety signals; TRAEs with potential immunologic etiology resolved in most patients with the use of established management algorithms
- These data further support the use of NIVO + chemo as standard 1L treatment in patients with advanced GC/GEJC/EAC
